Spectre ID

Spectacular, safe, easy to detect

Spectre ID

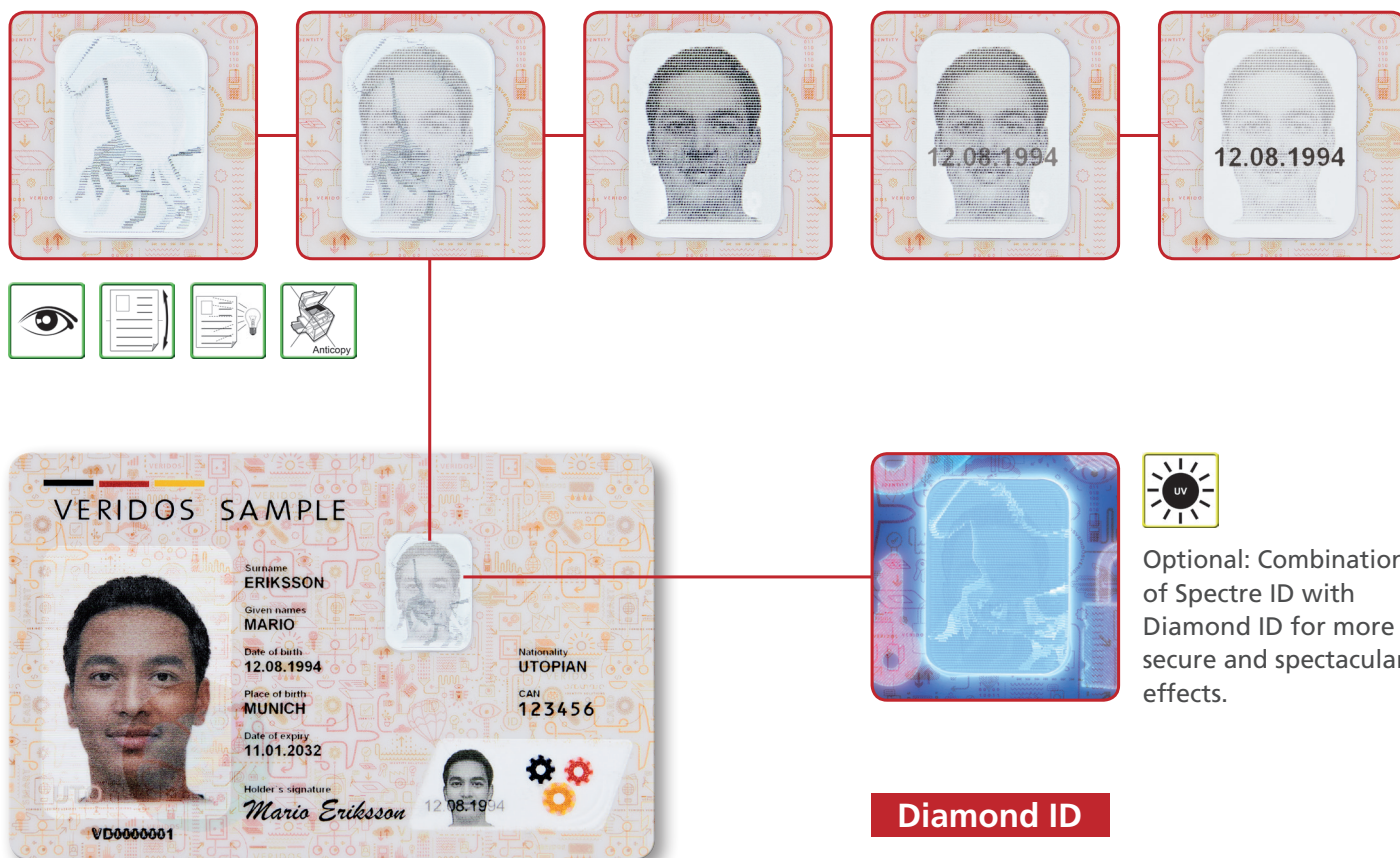

Spectre ID is a combination of two different lens structures on the front and rear side of the polycarbonate ID document. This combination creates a constant moving effect of the motif, integrated in the window area, when the ID is tilted.

Two different personalized data fields (like a MLI) can be added which will appear or disappear based on the viewing angle of the document. If attempts are made to alter the front or rear of the window, or to attempt its removal, the functionality of Spectre ID will be lost and the

attempted deception will become apparent. Additionally, attempts to overprint the ghost image similarly destroys the functionality of Spectre ID and will be easily detected.

A customized motif within Spectre ID is possible and customer specific requirements will be transposed into a unique and secure feature.

A combination of Spectre ID with Diamond ID will not only increase the security of the window but will lead to a more brilliant appearance. Read more on www.veridos.com.

Optional: Combination of Spectre ID with Diamond ID for more secure and spectacular effects.

Diamond ID

A special development of white UV pigments which are deeply integrated in the polycarbonate itself (not printed!), will highlight the Spectre ID functions and therefore create an additional spectacular, security effect.
